# Mục lục

<b>1. Thực hiện .....</b>	<b>4</b>
<b>2. Nạp và kết quả .....</b>	<b>9</b>
<b>3. Thay đổi thời gian tạo Request .....</b>	<b>11</b>

# 1. Thực hiện

```
main > C main.c > aReceptionTask()
1  #include <stdio.h>
2  #include <string.h>
3  #include <unistd.h>
4
5  #include "esp_log.h"
6  #include "esp_timer.h"
7  #include "esp_sleep.h"
8  #include "sdkconfig.h"
9
10 #include "freertos/FreeRTOS.h"
11 #include "freertos/task.h"
12 #include "freertos/timers.h"
13
14 #include "esp_system.h"
15 #include "esp_spi_flash.h"
16
17 #include "driver/gpio.h"
18 #include "driver/uart.h"
19
20 // #include "bootloader_random.h"
21
22
23
24 typedef struct
25 {
26     uint8_t ID;
27     bool flag;
28 } Data;
29
30 xQueueHandle aQueue;
31
32 void aReceptionTask();
33 // void aRequest();
34 void aProcess();
35 void aOtherProcess();
36
```

Data gồm có **ID** và **Flag** với **Flag** sẽ kích hoạt hàm **aProcess**.

Các chức năng:

- **aReceptionTask()**: sẽ tạo các **Request** sau mỗi 1 giây và thêm vào Queue
- **aProcess()**: Sẽ thực hiện khi có **Flag** = 1
- **aOtherProcess()**: thực hiện khi **Flag** = 0

Ý tưởng: **Flag** đóng vai trò là báo tín hiệu nguy hiểm, cần hàm xử lý đặc biệt (là **aProcess**). Nếu ko có nguy hiểm tho hệ thống hoạt động bình thường ( là hàm **aOtherProcess** )

Hàm **aReceptionTask** thêm các **Request** vào Queue mới điều kiện **ID** chia hết cho 3 tho bặt 1 **flag**

Khi **ID** chia hết cho 5 tho thêm request vào phía trước **Queue**, còn không tho thêm vào sau như bình thường.

Hàm **aProcess()** sẽ kiểm tra liệu item kế trong **Queue** có phải là **Flag** = 1 không. Nếu có thì **aProcess** xử lý, còn không thì **aOtherProcess** sẽ tiếp nhận xử lý

```

void app_main() {
    aQueue = xQueueCreate(8, sizeof(Data));

    xTaskCreate(
        aReceptionTask,          /* Task function. */
        "Queue Gateway",        /* String with name of task. */
        10000,                  /* Stack size in bytes. */
        NULL,                   /* Parameter passed as input of the task */
        1,                      /* Priority of the task. */
        NULL                    /* Task handle. */
    );

    xTaskCreate(
        aProcess,               /* Task function. */
        "Important Process",    /* String with name of task. */
        10000,                  /* Stack size in bytes. */
        NULL,                   /* Parameter passed as input of the task */
        0,                      /* Priority of the task. */
        NULL                    /* Task handle. */
    );

    xTaskCreate(
        aOtherProcess,          /* Task function. */
        "Other Process",        /* String with name of task. */
        10000,                  /* Stack size in bytes. */
        NULL,                   /* Parameter passed as input of the task */
        0,                      /* Priority of the task. */
        NULL                    /* Task handle. */
    );
}

```

```

void aReceptionTask() {
    uint8_t count = 0;
    const TickType_t aTicksToWait = pdMS_TO_TICKS(500);

    while (1)

The screenshot shows a CMake IDE with two tabs: 'main.c' and 'CMakeLists.txt'. The 'main.c' tab is active, displaying a C program with the following code:

```
main > C main.c > aReceptionTask()
117
118     while(1) {
119         aStatus = xQueuePeek(aQueue, &nData, aTicksToWait);
120
121         if (aStatus == pdPASS) {
122             if (nData.flag == 1) {
123                 aStatus = xQueueReceive(aQueue, &nData, aTicksToWait);
124                 if (aStatus == pdPASS)
```

Below the code editor, there is a panel with four tabs: 'PROBLEMS', 'OUTPUT', 'DEBUG CONSOLE', and 'TERMINAL'. The 'TERMINAL' tab is selected, showing the output of the program. The output consists of a list of messages: 'Process Data with ID: X and FLAG = Y', where X is the ID and Y is the FLAG. The IDs range from 1 to 47, and the FLAG is either 0 or 1. The output is as follows:

```
Process Data with ID: 1 and FLAG = 0
Process Data with ID: 2 and FLAG = 0
Process Data with ID: 3 and FLAG = 1

Process Data with ID: 44 and FLAG = 0
Process Data with ID: 46 and FLAG = 0
Process Data with ID: 47 and FLAG = 0
```

Tại mỗi **Data** với **ID** chia hết cho 3 tho dc hàm aProcess xử lý

Tại data với **ID** là 9 và 10 thì **ID** 10 được đưa vào **Front** của **Queue** nên dc xử lý trước 9.

### 3. Thay đổi thời gian tạo Request

Tiếp theo, ta giảm thời gian tạo **Request** xuống và giảm độ dài hàng xuống 3 thì tại thời điểm **Request** có **ID = 13** hàng chờ trả về trạng thái **errQUEUE\_FULL**

```
31
32 void aReceptionTask();
33 // void aRequest();
34 void aProcess();
35 void aOtherProcess();
36
37 void app_main() {
38     xQueue = xQueueCreate(3, sizeof(Data));
39
40     xTaskCreate(
41         aReceptionTask,      /* Task function. */
42         "Queue Gateway",    /* String with name of task. */
43         10000,              /* Stack size in bytes. */
44         NULL,               /* Parameter passed as input of the task */
45         1,                  /* Priority of the task. */
46         NULL                /* Task handle. */
47     );
48 }
```

```

71 void aReceptionTask() {
72     uint8_t count = 0;
73     const TickType_t aTicksToWait = pdMS_TO_TICKS(100);
74
75
